Introduction

Civic issues are common in every city. People face problems like potholes on roads, garbage not being collected, streetlights not working, water leakage, and drainage problems. These issues affect the safety and daily life of citizens. However, many times these problems are not solved quickly because people do not have an easy and proper method to report them. Traditional methods like visiting government offices, filling complaint forms, or calling municipal workers are slow, time-consuming, and not always effective. Sometimes complaints get lost, ignored, or take too much time to reach the right department.

To solve this problem, we created **CivicReports**. It is a simple and modern web application that allows citizens to report any civic issue easily using their mobile or computer. Instead of visiting an office, users can report the problem online within a few minutes. They can upload a photo of the issue, give a short description, select the type of issue, and mark the exact location on a map. This makes the report clear, accurate, and very helpful for authorities.

The platform is designed using modern technologies such as **React, TypeScript, Vite, Firebase, Tailwind CSS, shadcn/ui**, and **Leaflet Maps**. These technologies make the website fast, easy to use, responsive, and secure. Firebase helps store all the reports safely in a cloud database, while Leaflet Maps helps users mark the correct location of the problem on a map. We also added helpful features like **image compression** for faster uploads, **speech-to-text** for easy typing, and **real-time updates** so users can see the current status of their complaint.

For municipal officers or authorities, the system provides a special dashboard. They can view all the reported issues, filter them by category or area, and update the status to Pending, In-Progress, or Resolved. This helps them manage complaints faster and keeps the system organized. Citizens can also check the progress of their reports, which increases transparency and trust.

This project aims to improve communication between citizens and civic authorities. By using digital tools, civic problems can be reported quickly and solved faster. It also helps authorities understand which areas face more problems and what types of issues are most common. This helps in better planning and improving the city over time.

Objectives

The main goal of the CivicReports – Smart Civic Issue Reporting Platform is to make it easy for people to report civic problems and help authorities respond faster. Today, most civic issues remain unsolved because there is no simple and quick method for citizens to share complaints. Our project aims to solve this gap by using modern technology to create a digital system that connects citizens and government departments in a smooth and effective way.

The detailed objectives of the project are listed below:

1. To create an easy and user-friendly platform for citizens to report civic issues.
   Many people hesitate to report problems because traditional methods are complicated. Our goal is to give people a simple online tool where they can quickly report any issue.
2. To allow users to upload photos and descriptions of the problem for better clarity.
   A clear picture and explanation help authorities understand the issue more accurately and take the right action.
3. To capture the exact location of the problem using GPS and maps.
   Location plays an important role in civic issues. By using an interactive map, the authorities can directly locate the problem without any confusion.
4. To provide categories for different types of issues for easy sorting.
   Issues like garbage, potholes, water leakage, and streetlight failures can be categorized. This helps authorities assign the issue to the correct department.
5. To store all issue reports safely using a cloud database.
   Using Firebase Firestore ensures all complaints are stored securely and can be accessed anytime.
6. To give authorities a dashboard where they can manage, filter, and track complaints.
   The dashboard helps officers check all issues, update their status, and respond faster.
7. To ensure real-time updates for both citizens and authorities.
   When an issue is updated by an officer, the changes should be instantly visible to the user without delay.

8. To improve transparency by showing complaint progress to users.
   Citizens can check if their issue is pending, in progress, or resolved. This builds trust between the public and authorities.
9. To reduce manual paperwork and make the entire process digital.
   A digital platform reduces human errors, saves time, and makes record-keeping easier.
10. To support mobile-friendly and responsive design.
    The platform should work smoothly on phones, tablets, and computers so that anyone can report issues easily from anywhere.
11. To promote smart city development by using technology to solve real-life civic problems.
    Platforms like CivicReports help cities become cleaner, safer, and more organized.
12. To build a scalable system that can be expanded in the future.
    Features like AI-based suggestions, automatic department mapping, mobile apps, and detailed analytics can be added later.
13. To encourage public participation in civic improvement.
    The main objective is to motivate people to actively report issues and contribute to a better city environment.

Literature Survey

Many cities face repeated problems like potholes, overflowing garbage, broken streetlights, and water leaks. Researchers and developers have studied different ways to collect and manage these complaints so they can be solved faster. Below are the main ideas from earlier works and how they relate to our CivicReports project.

1. **Web-based complaint systems**
   Earlier studies show that web systems are much better than paper-based methods. Web systems let citizens send reports from home or mobile phones. They store all data in one place so officials can find and act on complaints quickly.
2. **Role-based access and security**
   Research emphasizes that systems must protect data and give different access to different people. For example, citizens should only file complaints and view their status, while municipal officers should be able to edit statuses and assign work. Role-based access reduces wrong changes and keeps data secure.
3. **Use of maps and geolocation**
   Several papers highlight the importance of mapping tools. When complaints include exact GPS locations or map pins, authorities can find problems faster and plan repairs more effectively. Maps also help spot problem areas where many complaints come from, which is useful for planning long-term fixes.
4. **Real-time databases and cloud storage**
   Using cloud databases (like Firestore) allows instant updates and easy scaling. Studies show that cloud storage improves collaboration between departments because everyone sees the latest information at the same time.
5. **Importance of multimedia (photos) and clear descriptions**
   Many researchers recommend including photos and short descriptions with complaints. Images give strong evidence and help officials understand the problem without visiting first. Clear categories (road, water, electricity, garbage) help route the report to the right department quickly.
6. **Analytics and trend detection**
   Finally, combining complaint data with charts and maps helps authorities find recurring issues and prioritize resources.

Project Details

4.1 Overview of the Project

CivicReports – Smart Civic Issue Reporting Platform is a web-based system that allows citizens to report civic problems in a simple, fast, and organized way. Problems like potholes, water leakage, garbage, broken streetlights, and other public issues can be reported using this platform. The goal of the project is to make communication between citizens and municipal authorities smooth, transparent, and digital.

Instead of visiting government offices or waiting for a response, citizens can upload a photo, write a short description, choose the type of issue, and select the exact location on a map. This makes the process very easy and helps authorities understand the issue clearly. The system also shows the status of the complaint so that citizens can check if it is pending, in progress, or solved.

The project uses modern tools like **React**, **TypeScript**, **Firebase**, and **Leaflet Maps** to create a fast, secure, and interactive platform. All data is stored safely in a cloud database and updates happen in real-time.

4.2 System Modules

4.2.1 Authentication Module

- Handles login using Google Authentication.
- Citizens and officers have different roles.
- Firebase manages secure login and user identity.
- Citizens can report issues.
- Officers can manage issues.

4.2.2 Citizen Dashboard

- Shows all reports submitted by the citizen.
- Displays updated status for each issue.
- Button for "Report New Issue."
- Simple design for easy use.
- Works smoothly on mobile phones.

4.2.3 Issue Reporting Module

- Most important part of the system.
- Users can:
  - Upload a photo
  - Write a short description
  - Select issue category
  - Pin the exact location on the map
- Supports voice input using speech-to-text.
- Compresses images for faster upload.

4.2.4 Map & Location Module

- Built using Leaflet Maps.
- Uses OpenStreetMap for free and open map data.
- Helps officers find the problem spot easily.

4.2.5 Officer Dashboard

- Officers can:
  - View all reported issues
  - Filter reports by category, date, or status
  - See photos and descriptions
  - View exact location on map
  - Change issue status: Pending → In-Progress → Resolved
- Helps manage reports faster and more clearly.

4.2.6 Real-Time Updates

- When officers update status, citizens see updates instantly.
- No need to refresh the page.
- Firestore handles this automatically.
- Improves transparency between citizens and authorities.

4.2.7 Data Visualization Module

- Uses Recharts to display data clearly.
- Shows:
  - Bar charts
  - Pie charts

4.3 Technology Stack Used

4.3.1 Frontend Technologies

- React
- TypeScript
- Vite

4.3.2 UI & Styling Tools

- Tailwind CSS
- shadcn/ui components
- Clean, modern, mobile-friendly UI

4.3.3 Backend and Database

- Firebase Authentication
- Firebase Firestore Database
- Firebase Storage for images
- Real-time updates

4.3.4 Map and Location Tools

- Leaflet Library
- React Leaflet
- OpenStreetMap

4.3.5 Additional APIs and Tools

- Speech Recognition API
- Canvas API for image compression

4.3.6 Deployment Tools

- Netlify for hosting

4.4 Working of the System

4.4.1 Step 1: Logging In

- Citizen opens the website
- Clicks on "Sign in with Google"
- Firebase verifies identity
- User enters dashboard instantly

4.4.2 Step 2: Reporting an Issue

- User clicks "Report Issue"
- Uploads image
- Writes description
- Selects category
- Pins location on map
- Submits the report
- Data stored instantly in Firestore

4.4.3 Step 3: Officer Views Complaint

- Complaint appears in officer dashboard
- Officer checks description
- Views image
- Checks map location
- Decides action

4.4.4 Step 4: Updating Issue Status

- Officer sets status:
    - Pending
    - In-Progress
    - Resolved
- Citizen sees status update in real time
- Ensures transparency

4.4.5 Step 5: Visualizing Data

- Officers can see all reports in charts

- Helps identify high-problem areas
- Helps plan resources

4.5 User Interface Details

4.5.1 Login Page

- Clean design
- Google login button
- Highly responsive

4.5.2 Citizen Dashboard

- Shows list of reported issues
- Status with colours
- Easy to read
- Button for new report

4.5.3 Report Form

- Fields:
  - Title
  - Description
  - Category
  - Image Upload
  - Map Location
- Submit button

4.5.4 Officer Dashboard

- Table of all reports
- Filters for:
  - Category
  - Area
  - Status
  - Date

- Buttons to update status
- Maps for exact location

Advantages & Limitations

CivicReports – Smart Civic Issue Reporting Platform offers several important advantages that make civic issue reporting easier, faster, and more transparent. At the same time, like any developing system, it also has a few limitations that can be improved in future versions.

5.1 Advantages

- Simple and Easy to Use
  Citizens can report issues quickly without any technical knowledge.
- Fast Issue Reporting
  Users can upload a photo, select a category, describe the problem, and mark the location within minutes.
- Accurate Location Detection
  The Leaflet map allows users to pin the exact location of the issue, helping officers find the spot easily.
- Real-Time Updates
  Any status change made by authorities is immediately visible to the citizen.
- Reduces Physical Work
  No need for paper forms or visiting government offices. Everything happens online.
- Better Communication
  The system improves coordination between citizens and municipal officers, making the process clearer and more organized.
- Secure Cloud Storage
  Firebase securely stores all reports, images, and user details.
- Helpful Dashboard for Officers
  Officers can filter, sort, and manage complaints more efficiently using the dashboard.
- Mobile-Friendly Design
  The platform works smoothly on mobiles, tablets, and computers.
- Supports Smart City Initiatives

Helps authorities study trends and plan improvements using charts and maps.

5.2 Limitations

- Requires Internet Connection
  Users must have internet access to report issues or view updates.
- No Mobile Application
  Currently, the platform is available only as a web application, not as an Android or iOS app.
- No Automatic Routing
  Issues are not automatically assigned to the correct department; officers must do it manually.
- No Notification System
  The system does not send SMS or email alerts for updates.
- Location Accuracy Depends on GPS
  Incorrect or weak GPS signals may affect location precision.
- No Offline Mode
  Users cannot report issues without internet connectivity.
- Dependent on Firebase
  If Firebase services face downtime, the system may slow down or stop temporarily.

Conclusion & Future Scope

6.1 Conclusion

CivicReports – Smart Civic Issue Reporting Platform is created to make reporting civic problems easy and fast for citizens. Many people face issues like potholes, garbage, water leakage, or broken streetlights, but they do not always know how to report them. The old methods of visiting offices or filling forms are slow and inconvenient. Our project solves this problem by giving people a simple digital platform where they can report any issue with a photo, description, and exact location on a map.

The system helps municipal officers see all complaints clearly in one place. They can check details, update the issue status, and take action faster. Citizens can also track the progress of their reports, which improves trust and transparency. Using technologies like React, Firebase, and Leaflet Maps, the platform becomes reliable, fast, and easy to use. Overall, the project successfully shows how technology can improve civic services and support cleaner, safer, and better-managed cities.

6.2 Future Scope

In the future, CivicReports can be improved and expanded with many new features:

- A **mobile app** for Android and iOS to make reporting even easier.
- **Automatic assignment** of complaints to the correct department.
- **SMS or email notifications** to inform citizens of status updates.
- **Advanced charts and heatmaps** to show areas with frequent problems.
- **Offline mode** to allow reporting without internet.

These features can make the platform more powerful and useful for smart city development.
